

Acquired Infections in Long Term Care: Pneumonia

WWLHIN Nurse Led Outreach Team

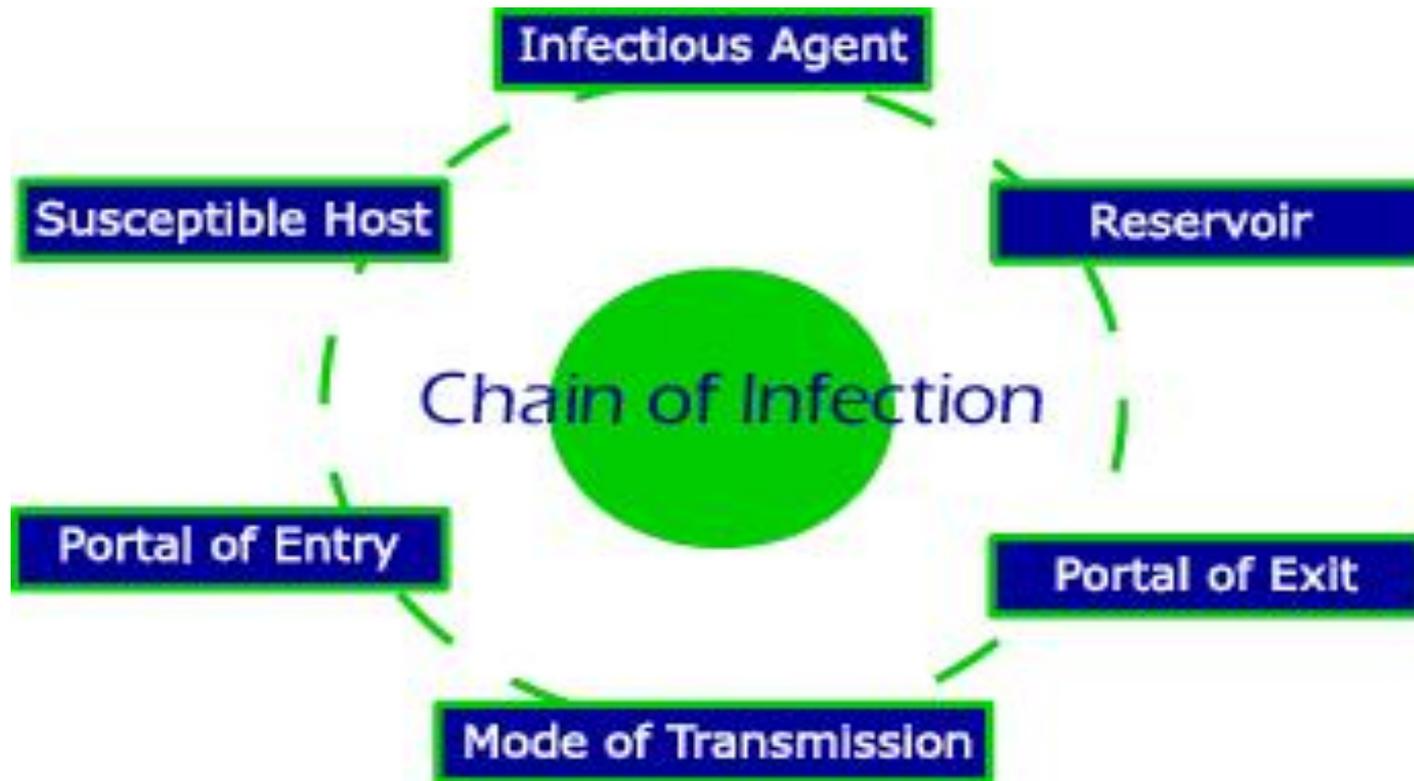

Miller Longanilla

David Scratch

Objectives

- To gain understanding of the chain of infection (5 minutes)
- Hand Hygiene – Breaking the chain of infection- *Glo-Germ (Interactive exercise) (5 minutes)*
- Pneumonia Protocol (20 minutes)

Chain of Infection

Your 4 Moments for Hand Hygiene

1 BEFORE initial resident / resident environment contact	WHEN? Clean your hands when entering: <ul style="list-style-type: none"> • before touching resident or • before touching any object or furniture in the resident's environment WHY? To protect the resident/resident environment from harmful germs carried on your hands
2 BEFORE aseptic procedures	WHEN? Clean your hands immediately before any aseptic procedure (e.g., oral dental care, eye drops, catheter insertion and changing a dressing) WHY? To protect the resident against harmful germs, including the resident's own germs, entering his or her body
3 AFTER body fluid exposure risk	WHEN? Clean your hands immediately after an exposure risk to body fluids (and after glove removal) WHY? To protect yourself and the health care environment from harmful resident germs
4 AFTER resident / resident environment contact	WHEN? Clean your hands when leaving: <ul style="list-style-type: none"> • after touching resident or • after touching any object or furniture in the resident's environment WHY? To protect yourself and the health care environment from harmful resident germs

How to handrub

Rub hands for 15 seconds

1 Apply 1 to 2 pumps of product to palms of dry hands.

2 Rub hands together, palm to palm.

3 Rub in between and around fingers.

4 Rub back of each hand with palm of other hand.

5 Rub fingertips of each hand in opposite palm.

6 Rub each thumb clasped in opposite hand.

7 Rub hands until product is dry. Do not use paper towels.

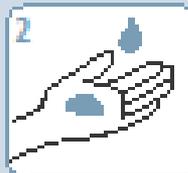

8 Once dry, your hands are safe.

How to handwash

Lather hands for 15 seconds

1 Wet hands with warm water.

2 Apply soap.

3 Lather soap and rub hands palm to palm.

4 Rub in between and around fingers.

5 Rub back of each hand with palm of other hand.

6 Rub fingertips of each hand in opposite palm.

7 Rub each thumb clasped in opposite hand.

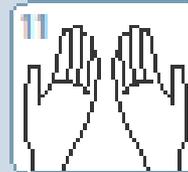

8 Rinse thoroughly under running water.

9 Pat hands dry with paper towel.

10 Turn off water using paper towel.

11 Your hands are now safe.

JUST CLEAN YOUR HANDS

Hand Hygiene Fact Sheet for Health Care Settings

In health care settings, hand hygiene is the single most important way to prevent infections.

Hand hygiene is the responsibility of the organization and all individuals involved in health care. Hand hygiene is a core element of client/patient/resident safety for the prevention of health care-associated infections and the spread of antimicrobial resistance. There are two methods of performing hand hygiene:

1. ALCOHOL-BASED HAND RUB (ABHR)

Alcohol-based hand rub is the preferred method for decontaminating hands. Using ABHR is better than washing hands (even with an antibacterial soap) when hands are not visibly soiled:

- ABHRs provide for a rapid kill of most transient microorganisms
- ABHRs contain a variety of acceptable alcohols in concentrations from 60 to 90%; 70 to 90% is preferred for health care settings
- ABHRs are not to be used with water
- ABHRs contain emollients to reduce hand irritation
- ABHRs are less time-consuming than washing with soap and water
- If running water is not available, use moistened towelettes to remove the visible soil, followed by ABHR.

2. HAND WASHING

Hand washing with soap and running water must be performed when hands are visibly soiled. Antimicrobial soap may be considered for use in critical care areas but is not required and not recommended in other care areas. Bar soaps are not acceptable in health care settings except for individual client/patient/resident personal use.

YOUR 4 MOMENTS FOR HAND HYGIENE

- 1. Before initial client/patient/resident or environment contact**
When? Clean your hands when entering:
 - before touching client/patient/resident or
 - before touching any object or furniture in the client/patient/resident's environment.**Why?** To protect the client/patient/resident and their environment from harmful germs carried on your hands.
- 2. Before aseptic procedure**
When? Clean your hands immediately before any aseptic procedure.
Why? To protect the client/patient/resident from harmful germs, including his/her own germs, entering his or her body.
- 3. After body fluid exposure risk**
When? Clean your hands immediately after an exposure risk to body fluids (and after glove removal).
Why? To protect yourself and the health care environment from harmful client/patient/resident germs.
- 4. After client/patient/resident or environment contact**
When? Clean your hands when leaving:
 - after touching client/patient/resident or
 - after touching any object or furniture in the client/patient/resident's environment.

Why? To protect yourself and the health care environment from harmful client/patient/resident germs.

FACTORS THAT REDUCE THE EFFECTIVENESS OF HAND HYGIENE

The following factors reduce the effectiveness of hand hygiene:

- **Condition of the skin:** See Section 4, "Hand Care", for information about maintaining skin integrity.
- **Nails:** Long nails are difficult to clean, can pierce gloves and harbour more microorganisms than short nails. Nails must be kept clean and short.
- **Nail polish:** Only nail polish that is fresh and free of cracks or chips is acceptable.
- **Artificial nails or nail enhancements** are not to be worn by those giving care.
- **Jewellery:** Hand and arm jewellery hinder hand hygiene. Rings increase the number of microorganisms present on hands and increase the risk of tears in gloves. Arm jewellery, including watches, should be removed or pushed up above the wrist before performing hand hygiene.
- **Products must be dispensed in a disposable pump container that is not topped-up, to prevent contamination**

Why is Pneumonia important to LTC Populations?

- Incidence rate of 1.1.2 per 1000 patient days, and accounts for 13%-48% of all LTC infections.
- 33 out of 1000 LTC Home residents are hospitalized with LTC Acquired Pneumonia versus 1.14 out of 1000 in the community.
- There is a need for early detection in-home (within the LTC home) as opposed to relying on transfer to acute care. For frail individuals in LTC homes there are potential adverse outcomes related to transfer to acute care.
- Delay in administration of antibiotics for the empiric treatment of LTC Acquired Pneumonia may lead to increased resident morbidity and mortality. Initiation of antibiotic after eight hours is associated with increased mortality.

Clinical Practice Guideline - Pneumonia

SIGNS AND SYMPTOMS OF PNEUMONIA

If a chest X ray is not available, rapid or fast breathing and at least 1 of the following signs and symptoms should be present if the resident is to be diagnosed with pneumonia.

Fast or Rapid Breathing (Tachypnea)

- ✓ This is the most important sign
- ✓ Breathing rate of ≥ 25 breaths in a full minute is a sign that needs to be reported to the RPN or RN

AND AT LEAST ONE OF THE FOLLOWING

- ❖ Fever
 - Temperature of 37.8 or greater. Older persons may have a fever when the reading is lower on the thermometer than would be expected for a younger person.
Chills and shaking (rigors) are an important marker of infection.
- ❖ Chest Pain (Pleuritic Chest Pain)
 - Pain in the chest is often a sign of pneumonia especially if the resident has not had chest pain previously.
- ❖ Cough
 - A new cough with phlegm or even a cough without is an important sign
- ❖ Noisy Breathing
 - There may be wheezes or crackling that can be heard when the resident breathes.
- ❖ Signs of low oxygen levels (Hypoxemia)
 - This may be noticed by blue or purple lips and nail beds where the resident normally has pink lips and nails.
- ❖ New or More Confusion or Behaviours
- ❖ Shortness of Breath (Dyspnea)
- ❖ Fast or Rapid Pulse or Heart Rate

Adapted Guideline for the Identification and Management of Pneumonia

MANAGEMENT

Assessment

- ❖ If you are aware that the resident or his/her family has specific ideas for treatments when the resident is ill inform the RPN /RN
- ❖ Provide comforting care for example , changing the resident's position from lying to sitting up along with activities such as taking the temperature under the direction from RPN/RN
- ❖ Adequate fluid intake – Try to encourage fluids. A resident needs to drink at least 1 litre or 4/250 cc glasses in 24 hours to replace fluid loss.
- ❖ Be alert for signs of increasing illness such as increased or new coughing, difficulty breathing and increased listlessness or confusion. Report any new or increasing signs to the RPN/RN.
